## RoboCup 2004 <sup>(1/2)</sup>

As an undergraduate I participated in a yearlong **robotics project** in which we programmed ERS-210 and ERS-7 robotic dogs made by Sony to compete in the Standard Platform League (SPL) of the international **RoboCup 2004 competition**.

Our technical report [1] provides an in-depth look into the core challenges of teaching robots to play soccer, the solutions developed by our team, and the involved support infrastructure.

As part of the GermanTeam – a collaboration between the universities of Berlin, Bremen, Darmstadt, and Dortmund – we won the world championship in the SPL as well as the SPL Open Challenge.

We developed a **decentral scheduling algorithm** that allows multiple robots to coordinate their behavior to achieve a common goal in a challenging, dynamic environment where communication might be intermittent and the number of robots might change without prior notice [2, 3].

Characteristics of our approach:

- synchronization free
- low-bandwidth broadcast communication
- graceful degradation in case of
  - communication outages
  - loss of team members
- continuous replanning

Schematic of the proposed scheduler [2].

The scheduling algorithm was successfully used during the RoboCup 2004 competition winning the Standard Platform League Open Challenge [1]. [video](#)

My diploma thesis [4] presents a novel approach to **discover objects in unlabeled image data** using a combination of traditional methods including image segmentation, feature extraction, clustering, and dynamic programming.

The key idea consists of using **image segmentation to group features** in an image, and use these feature groups to represent the individual segments in a way that is invariant to rotation, scale, and translation.

Such feature segments can then be related to each other by an appropriate distance measure to **identify segments that occur repeatedly** in different contexts.

Finally, neighborhood relations among segments can be learned in a similar fashion to **discover stable feature segment constellations** that indicate the presence of reoccurring structures, i.e., putative objects in the images.

In [5] we present details of the **image segmentation** algorithm that was first introduced in my diploma thesis.

The algorithm has a focus on **robustness with respect to noise and discontinuous structures** like tree foliage.

Overview of the segmentation algorithm [5].

The algorithm was featured on the title page of “Informatik Spektrum” [6], the main organ of the German Informatics Society (GI).

Illustration of distances on a learned topology [7].

Classification of feature vectors into 8 pairwise neighboring nodes. Columns represent nodes. Each column contains examples of 10 feature vectors mapped onto the respective node [7].

In [7] we present details of the **feature similarity measure** that was first introduced in my diploma thesis. The measure utilizes a **learned topology** of the feature space and does not rely on distance in Euclidean space.

Key ideas:

- Utilize a growing neural gas (GNG) to learn a piecewise representation of the feature space as well as its topology.
- Determine the shortest path between all pairs of nodes in the topology.
- The (dis)similarity between two features  $f_1$  and  $f_2$  is then given as the shortest path between those nodes  $g_1$  and  $g_2$  onto which the features are mapped by the GNG.

## Project C-Manipulator (1/4)

**C-Manipulator** [8] is a research project that was conducted from 2006 to 2009 at the German Research Center for Artificial Intelligence (**DFKI**) in Bremen.

Its main objective was the development of a **manipulator system for deep sea applications** that provides autonomous and assistive functions to the system's operators.

The project used a **hydraulic ORION 7P** by Schilling Robotics as its main robotic arm. As main sensors, the system was equipped with two overhead cameras used for stereo vision and a single camera mounted to the wrist for visual servoing.

The project was finished successfully with an open water test in coastal waters. [video](#)

## Project C-Manipulator (2/4)

In [9] we report on **early results** of the C-Manipulator project that introduce a number of improvements over the traditional, manual control of underwater robotic arms:

- We developed a **fast inverse kinematic closed form solution** that allows movements in cartesian space and guarantees numerical stability.
- We implemented a two-phase, **semi-autonomous gripping** of objects. [video](#)

## Project C-Manipulator (3/4)

3d plot of tip displacement during movement compensation [10].

Deep sea robotic arms are usually mounted to remotely operated vehicles (ROV). We developed a **novel algorithm to compensate for disturbances** that does not rely on the station-keeping algorithm of the ROV but compensates vehicle movements directly **via a movement overlay** in the robotic arm [10]. [video](#)

We **augmented the built-in controller** of the ORION 7P with a multi-layered controller enabling **high precision end-effector control** well beyond the manipulator's original capabilities [11]. We showcased the achievable precision by the automated plugging of an underwater connector. [video](#)

Automated plugging of a Gisma Series 80 underwater connector [11].

## Project C-Manipulator (4/4)

One of the primary tasks of modern ROV deployment is **intervention work**. Intervention in these cases consists of tasks like opening fixtures, or plugging connections.

Robotic operators have to rely solely on visual feedback and their experience to determine if in a given situation a desired position is reachable, and how much dexterity will be available to perform the intended task.

We introduced a **methodology to represent workspace properties** like remaining dexterity with respect to tele-operation tasks [12]. The information gained can be used as a signal to an operator or as the basis for motion commands to the ROV carrying the robot arm.

Nominal workspace of the ORION 7P [12].

Dexterous workspace of the ORION 7P for a front-down position of the gripper [12].
